CareSphere AI
10-slide submission kit

NARRATION SCRIPT + RECORDING GUIDE

Arnav Kochar · Congressional App Challenge 2026 · CA-10

Target final video: 2:56. Ten slides plus an 80-second real app demonstration. The four-second margin is intentional; rehearse and check the duration of the exported file, including pauses and transitions.

How the video works

0:00–0:58: Slides 1–5 establish purpose, audience, features, games and design rationale.

0:58–1:01: Slide 6 gives the one clear handoff.

1:01–2:21: Show the running app, not a slideshow. Use the shot plan on page 3.

2:21–2:56: Return to slide 7, then finish slides 8–10.

Files and use

CareSphere_CAC_Final_10_Slides.pptx is the recommended short deck. Its speaker notes match this script. The 21-slide master remains a backup, not part of this recording. Use Slide Show mode; transitions are click-driven, not automatic.

Before saying “I built” or “I learned”

Use your own voice. Change any phrasing that does not match your actual contribution, understanding or experience. Disclose AI development assistance accurately in the application. Do not invent an origin story, testers, testimonials or clinical outcomes.

Script | before the app

Slide 1 | 0:00–0:10 | Title and purpose

I'm Arnav Kochar. CareSphere AI combines routines, self-paced activities, human connection and visit preparation for older adults, autistic people and their families.

Slide 2 | 0:10–0:20 | The design problem

Daily support should not feel like another task. CareSphere brings reminders, low-pressure activities and ways to connect into one predictable place, with the person in control.

Slide 3 | 0:20–0:32 | What the app does

There are four areas: activities and sensory tools; mood, routines and medication self-check-ins; Coffee Circles for video conversations; and a visit brief made from information you choose.

Slide 4 | 0:32–0:46 | Four self-paced games

Feelings Explorer has no correct answer. Pattern Recall lets you repeat a sequence. Picture Pairs reveals matching cards, and Picture Story explores a sequence at your pace. All are untimed and unscored.

Slide 5 | 0:46–0:58 | Sensory choice and research

Breathing and optional soundscapes are user-controlled. Accessibility research informed predictable navigation and sensory choices. Game research is promising but varied; these activities are not validated therapy.

Slide 6 | 0:58–1:01 | Switch to the running app

Let’s see CareSphere in action.

At the end of slide 6: cut or switch immediately to the already-open app. Do not display additional demo-introduction slides.

Live demonstration | 80 seconds

Prepare the app in advance. These are editing targets, not rigid waits. Narrate the actual action and result. The app can be recorded separately and edited into the video; do not misrepresent prerecorded footage as a real-time event for judges.

1:01–1:21 | Activities → Pattern Recall

Start pattern, watch the actual pads, repeat the sequence. Continue or replay if needed. Show one genuine interaction loop; do not fake a correct answer.

1:21–1:33 | Activities → Picture Pairs

Reveal two cards. A mismatch is fine: show the low-pressure interaction rather than pretending it is a match.

1:33–1:42 | Activities → Soundscapes

Tap Rain, let it play briefly, then Stop. Keep volume comfortable. A pause in narration lets judges hear the effect.

1:42–1:55 | Overview

Choose a mood and complete a routine. If a medication status is visible, describe it only as a self-report, not a verified dose.

1:55–2:01 | Coffee Circles

Show a real room and its Join control. Do not imply a call occurred just by showing the link. No need to enter or wait in an empty meeting.

2:01–2:21 | Care Circle → Prepare visit brief

Select fields; show the exact preview. Download .txt if there is time. Use fictional data; do not export or expose private patient information.

Suggested continuous narration

Here I watch a pattern and repeat it. I can replay or stop. In Picture Pairs, I reveal and compare cards without a countdown. I choose when rain starts and stops. Back on Overview, I record a mood and finish a routine. Coffee Circles provides real Jitsi room links. Before a visit, I select fields for a brief and inspect the exact text. It's user-prepared information, not a verified medical record.

Allow quiet pauses for watching the pattern, seeing feedback and hearing rain. If scrolling takes too long, cut dead time rather than making every action too fast to follow. If the game differs from the narration, describe what really happened.

Script | after the app

Slide 7 | 2:21–2:33 | Tools, languages and privacy

The web app uses JavaScript, React and Web Audio. The native iPhone app uses Swift and SwiftUI. Care data is encrypted locally; Jitsi calls and online references use external services.

Slide 8 | 2:33–2:45 | A specific coding challenge

Old Bluetooth callbacks could update a new session. A generation counter rejects stale callbacks. Each accepted sample stays labeled live or simulated, including when exported.

Slide 9 | 2:45–2:52 | Next step and learning

Next: co-design and usability testing. A working feature isn't proof of real-world benefit.

Slide 10 | 2:52–2:56 | Close

CareSphere AI. Everyday support, on your terms. Thank you.

Return cue

After showing the brief preview, return to slide 7, “Two clients. Local-first care.” Continue to 8, 9 and 10. Do not reopen the longer master deck.

What is deliberately omitted

Repeated tab tours and demo agendas, a full release timeline, long architecture diagrams, population-statistic slides and a separate learning slide. The remaining content answers what the app does and shows it working. Full research references stay in notes and this guide.

Setup and final checks

1. Prepare the screen

Open the real web app in Chrome or Edge. Use a readable window and font size; hide unrelated tabs and personal notifications. Use fictional sample data, with an editor-added “sample data” caption when appropriate.

2. Prepare the interactions

Locate Pattern Recall, Picture Pairs and Soundscapes. Know how to stop audio. Have a routine and fictional care data ready. Open Coffee Circles only to show the real Join control; do not join strangers or imply a call occurred.

3. Capture app footage

Record the viewport and cursor with OBS, QuickTime or another local recorder. Use deliberate movements. Do not substitute a slide, fake UI animation or AI-generated imagery for genuine app behavior.

4. Protect privacy and safety

Do not call SOS, reveal patient information or show real medication details. Medication status is self-report. Simulated vitals must remain labeled. Native iPhone capabilities require native footage if demonstrated; the deck images are web UI.

5. Assemble and rehearse

Record the voice in your own words. Edit the actual actions into the 80-second slot. If anything runs long, trim wording or a secondary action, never claim a result not shown. Check the final export is no more than 3:00.

6. Submit

Upload to YouTube or Vimeo as public. Open the link signed out to verify access. Confirm it starts with https. Include the correct public link in the application; the slides alone are not the demonstration submission.

Sources and honest boundaries

Official video requirements

The 2026 rules call for a public 1–3 minute video naming participants and app, giving a clear purpose, identifying the audience and tools/languages, and demonstrating functionality. This is not a video-production competition.

Research informing the design

Raymaker et al. (2019), AASPIRE web accessibility guidelines.

https://pmc.ncbi.nlm.nih.gov/articles/PMC6485264/

Supports the accessibility design rationale, not clinical efficacy.

Alahmari et al. (2023), computer-based games and autism, systematic review.

https://pmc.ncbi.nlm.nih.gov/articles/PMC9809031/

Interventions and study designs vary; findings do not establish benefits of these CareSphere games.

Liu et al. (2025), gamified digital health and autism, systematic review/meta-analysis.

https://pmc.ncbi.nlm.nih.gov/articles/PMC12781649/

Trial limitations and differences prevent a claim that CareSphere treats autism or improves cognition.

CareSphere activities are optional practice and enjoyment, not validated therapy, screening or cognitive assessment. Game-review interpretation follows docs/activities-and-accessibility.md; this kit is not an independent clinical evidence appraisal.

Example-video review

The structure uses the explicit handoff from CivicBridge and task/action/result patterns found in transcripts of WaterWise, Care Path and Knowledge Knockout. These are district winners/placers, not a national best-video ranking. Full video files or frames were not captured; no third-party footage is included. Detailed analysis: analysis/SLIDE_AND_WINNER_ANALYSIS.md.
